

Playlist Area

The largest area of the user interface is available below the control section for the playlist and its configuration. Here, you will find all clips that you have prepared for playback with PLAYDECK, clearly arranged in the respective playback blocks. A playback block consists of the block header with block name and information about scheduled start times, one or more lines of media (videos, still images, audio tracks) or live inputs with the associated information, and a block end that defines the behavior of PLAYDECK when reaching the end of a block. To keep track of longer blocks, the view of the playlist can be customized in many ways. For more information about working with playlists, please refer to chapter 3.
